

**ABSTRACT**

An improved tool holder including a holster and a rigid mounting panel attached to and extending above the holster. The holster defines a generally rectangular cross-sectional cavity for receiving pricing and labeling tools, and which may include a concave recess along the top of the side panels for accommodating the tools. The rigid mounting panel is used to attach the holster to a belt or waist band of the garment of a user. The lower opening of the holster cavity is substantially the same size as the upper opening thereby permitting insertion of a large variety of pricing and labeling tools. The symmetrical configuration of the holster permits a user to wear the holster on either the left or right side of the user's body while maintaining the gun in a forward facing position.
